

The **ELITE** system is the new way to dispense reinforcing fiber. The old way, manually throwing bags of fiber in to the mixer, no longer makes business sense.

The **ELITE** system is fully automatic and integrates with any batch control system. Just fill it with loose fiber and the **ELITE** does the rest.

The **ELITE** comes in one of two configurations, single-bin and double-bin.

- The **single-bin** configuration holds one type of fiber at a time. It is used in application where only one type of fiber is employed.
- The **double-bin** configuration can hold two different types of fiber simultaneously and can dispense one of the other depending upon the customers application.

The Elite system is available in 3 different size families:

- Original Model
- “S” Model
- “T” Model

The **ELITE** system dispenses fiber **by weight** using a decumulative formula. This provides for a very high level of dosing accuracy.

The **ELITE** system delivers the dosed fiber using a **pneumatic delivery system** driven by compressed air. The fiber is delivered to the plant (usually the mixer or the aggregate hopper) via PVC piping. This eliminate the need for any additional conveyors in the plant.

The ELITE Fiber Dispenser System is the most reliable, the most accurate, and the most cost effective fiber dosing/delivery system on the market today.
